The first stage of the project involves identifying your **target user group**, determining what you think is the **problem** to be solved, and what **current systems** there are that try to solve this problem. This is the first step towards identifying and understanding the problem space.

Carefully consider who the **stakeholders** are for the problem space you are addressing, and whether you can **realistically** get access to the main target users. Possibly difficult user groups include young children, seniors, and groups you don't normally encounter, so consider **avoiding** these groups unless you are certain you can talk to them.

You will present your responses as part of the tutorial deliverables in Week 5. The slide deck will consist of **3 slides**, one per point:

1. **Who** is your **target audience**?
2. What do you think is the **problem**?
3. What **current systems** are there that try to **solve** this problem?

The presentation should be roughly **5 minutes** in length.

Target users

The system is designed for individuals living in shared housing environments in Singapore where finances and responsibilities are separate but interdependent (e.g. young professionals, digital nomads, etc)

Problem

Information Fragmentation:
Communication is scattered across platforms (e.g. WhatsApp (chat), Splitwise (bills), bank apps (transfers), and physical notes (chores)). Finding a specific bill or agreement requires digging through weeks of chat history.

Social Friction & "Awkwardness":
Manually reminding a friend to pay for utilities or take out the trash creates social tension. This "nagging" often leads to house-mate conflict.

High Manual Overhead:
As mentioned before, manually maintaining a Google Doc with links and receipts is tedious. It's prone to human error, and if one person stops updating it, the whole system collapses.

What current system can do to solve this problem

Feature	Problem Solved	Impact
Unified Financial Ledger	Bill Confusion	One interface to upload utility bills (water, Wi-Fi). The system calculates the split and tracks who has paid, replacing manual spreadsheets.

Automated Reminders	Social Awkwardness	The system sends automated notifications for upcoming rent or late payments. It moves the "blame" from a person to the software.
Shared Inventory Tracker	Supplies Running Out	A collaborative list for communal items (toilet paper, detergent). When an item is marked "low," it notifies whoever is near a supermarket.
Integrated Chore Calendar	Accountability Issues	A digital rotation for cleaning and maintenance. It marks deadlines and allows users to "Check-in" when a task is done for everyone to see.
Centralized Link Vault	Decentralization	A pinned section for the Tenancy Agreement, landlord contact, Wi-Fi passwords, and digital keys—no more searching through emails.
